# Goals of “BEST” Treatment<sup>1,2</sup>

1. Relieving presenting symptoms

2. Preventing progression to acute mesenteric ischemia

3. Improving quality of life

# Goals of “BEST” Treatment

1. Relieving presenting symptoms

2. Preventing progression to acute mesenteric ischemia

3. Improving quality of life

Open surgery >> Endovascular  
At least 7 reasons why.

# 1. PATENCY

- Well established in open repair: up to 92% primary patency at 5 years<sup>3-4</sup>.
- Five systematic reviews showing lower primary patency in endovascular compared to open, up to 5 year follow up<sup>5-9</sup>.
- Lower secondary patency in endovascular vs. open<sup>9</sup>.

## Endovascular Versus Surgical Revascularization for the Management of Chronic Mesenteric Ischemia

Mahmud Saedon, MBChB, MRCS<sup>1,2</sup>, Athanasios Saratzis, MBBS, MRCS, PhD<sup>2,3</sup>, Ahmed Karim, MBChB, MRCS<sup>2,3</sup>, and Steve Goodyear, MBBS, MD, FRCS<sup>2,3</sup>

Forest plot summarizing primary patency rates for endovascular versus surgical reconstruction.

Open repair has 257% higher odds of achieving late primary patency compared to endovascular repair (OR 3.57, 95% CI 1.83-6.97,  $P=0.0002$ ).

## 2. RECURRENT SYMPTOMS

- Restenosis based on review of literature<sup>4</sup>:
  - Endo: 57%
  - Open: 24%
- Recurrent symptoms at 3 years from largest systematic review of 100 studies (n = 18820 patients):
  - Endo: 34%
  - Open: 15%

Overall weighted risk of symptom recurrence lower in open group compared to endo (RR 0.472, 95% CI 0.339-0.657, P=0.177).

### A systematic review and meta-analysis of endovascular versus open surgical revascularization for chronic mesenteric ischemia

Fares Alahdab, MD,<sup>a,b</sup> Remy Arwani, MD,<sup>c</sup> Ahmed Khurshid Pasha, MD,<sup>d</sup> Zayd A. Razouki, MBChB, MS,<sup>d</sup> Larry J. Prokop, MLP,<sup>a,e</sup> Thomas S. Huber, MD,<sup>f</sup> and M. Hassan Murad, MD, MPH,<sup>a,b</sup> Rochester, Minn; Cairo, Egypt; and Gainesville, Fla

Studies	RR (95% C.I.)	Ev/Open	Ev/Endovascular
Rose 1995	0.178 (0.010, 3.177)	0/8	2/7
Kasirajan 2001	0.915 (0.376, 2.226)	13/54	5/19
Sivamurthy 2006	0.397 (0.154, 1.022)	6/41	7/19
Atkins 2007	0.994 (0.432, 2.289)	11/49	7/31
Biebl 2007	0.178 (0.009, 3.522)	0/26	2/23
Zerbib 2008	0.134 (0.008, 2.382)	0/15	3/14
Oderich 2009	0.175 (0.083, 0.369)	8/146	26/83
Davies 2009	0.296 (0.013, 6.770)	0/17	1/15
Huynh 2009	0.382 (0.263, 0.556)	26/96	34/48
Tallarita 2011	0.591 (0.102, 3.420)	1/4	11/26
Kanamori 2014	0.522 (0.195, 1.396)	5/26	7/19
Barret 2015	0.740 (0.259, 2.117)	3/11	14/38
Arya 2016	0.675 (0.290, 1.573)	10/55	7/26
<b>Overall (I<sup>2</sup>=26.5%, P=0.177)</b>	<b>0.472 (0.339, 0.657)</b>	<b>83/548</b>	<b>126/368</b>

Forest plot summarizing 3-year recurrence rate of chronic mesenteric ischemia symptoms.

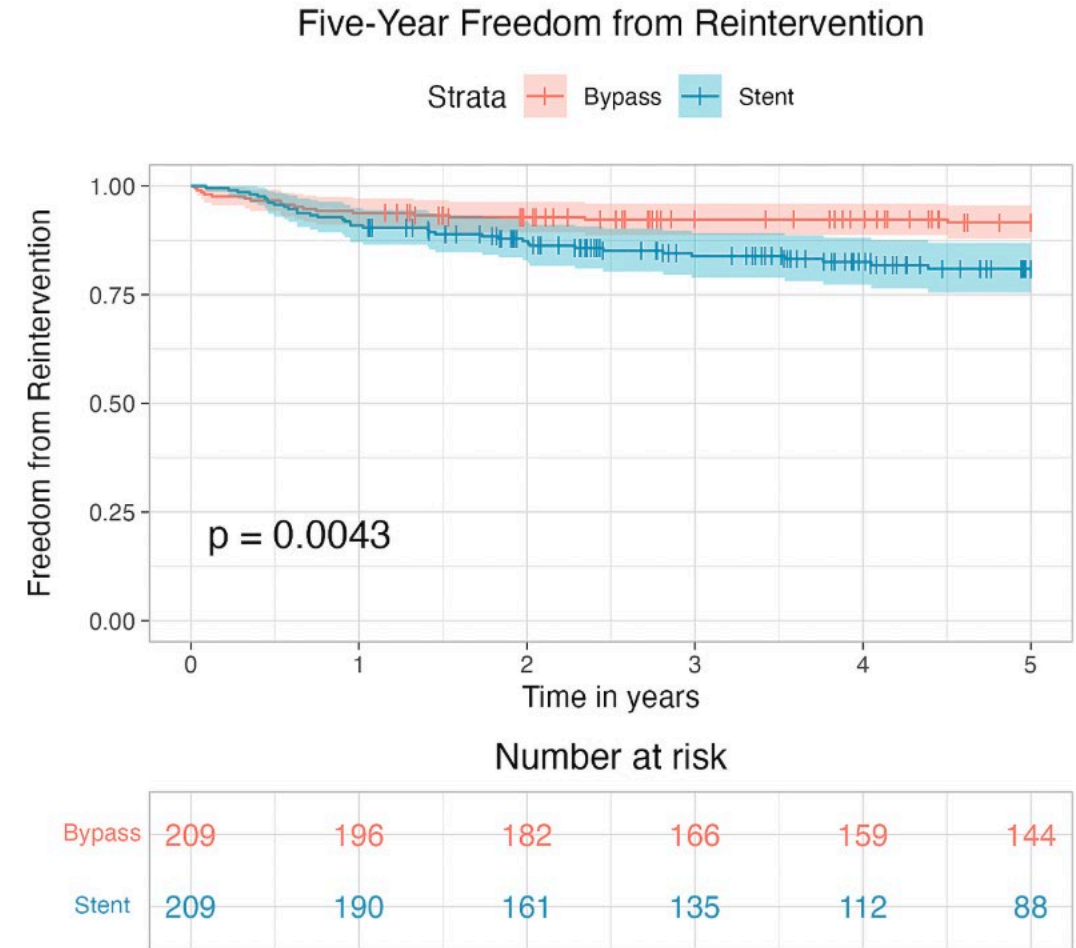

### 3. REINTERVENTIONS

- Up to ½ of restenoses in endovascular repair require reintervention<sup>10</sup>
  - Endo: 10-42%
  - Open: 0-27%
- Largest retrospective propensity-matched study (n=418) analyzing long-term outcomes after re-intervention for CMI<sup>11</sup>
  - Open repair associated with greater freedom from reintervention at 5 years ( $p < 0.01$ )

#### Long-term value in open and endovascular repair of chronic mesenteric ischemia

Daniel Lehane, BA, Joshua Geiger, MD, Baqir Kedwai, BHSc, Zachary Zottola, BS, Karina Newhall, MD, MS, Doran Mix, MD, Adam Doyle, MD, and Michael Stoner, MD, Rochester, NY

5-year freedom from reintervention in open and endovascular repair.

# 5. ANATOMICAL CONSTRAINTS

## ENDOVASCULAR

- X Eccentric calcifications
- X Flush occlusions of aorta
- X Long occlusions
- X Small vessel diameter
- X Tandem lesions affecting branches

## OPEN SURGERY

- ✓ Multiple options for inflow
- ✓ Endarterectomy & reconstruction possible
- ✓ Revascularization >1 vessel

## 6. EMBOLIZATION, DISSECTION, PERFORATION...

- Distal embolization reported in up to 8% of patients treated by SMA angioplasty & stent<sup>10</sup>
  - Higher for patients with SMA occlusion, long lesions (>30mm), severe calcification
- Risk of damage to outflow artery
- Access related complications (~16%)<sup>10</sup>
- Contrast & cumulative radiation exposure

## 5. PERIOPERATIVE COMPLICATIONS & RECOVERY

## 6. PERIOPERATIVE COMPLICATIONS & RECOVERY

- Higher length of stay and composite measure of perioperative complications in open vs. endo at 30 days.

### Endovascular Versus Surgical Revascularization for the Management of Chronic Mesenteric Ischemia

Mahmud Saedon, MBChB, MRCS<sup>1,2</sup>, Athanasios Saratzis, MBBS, MRCS, PhD<sup>2,3</sup>, Ahmed Karim, MBChB, MRCS<sup>2,3</sup>, and Steve Goodyear, MBBS, MD, FRCS<sup>2,3</sup>

Composite incidence of major nonfatal cardiac complications, nonfatal stroke, nonfatal bowel ischemia.

No difference between endovascular vs open surgery.

Forest plot summarizing incidence of composite endpoint for endovascular versus surgical reconstruction.

# PERIOPERATIVE COMPLICATIONS & RECOVERY

- Higher length of stay and composite measure of perioperative complications in open vs. endo at 30 days.

## Goals of “BEST” Treatment

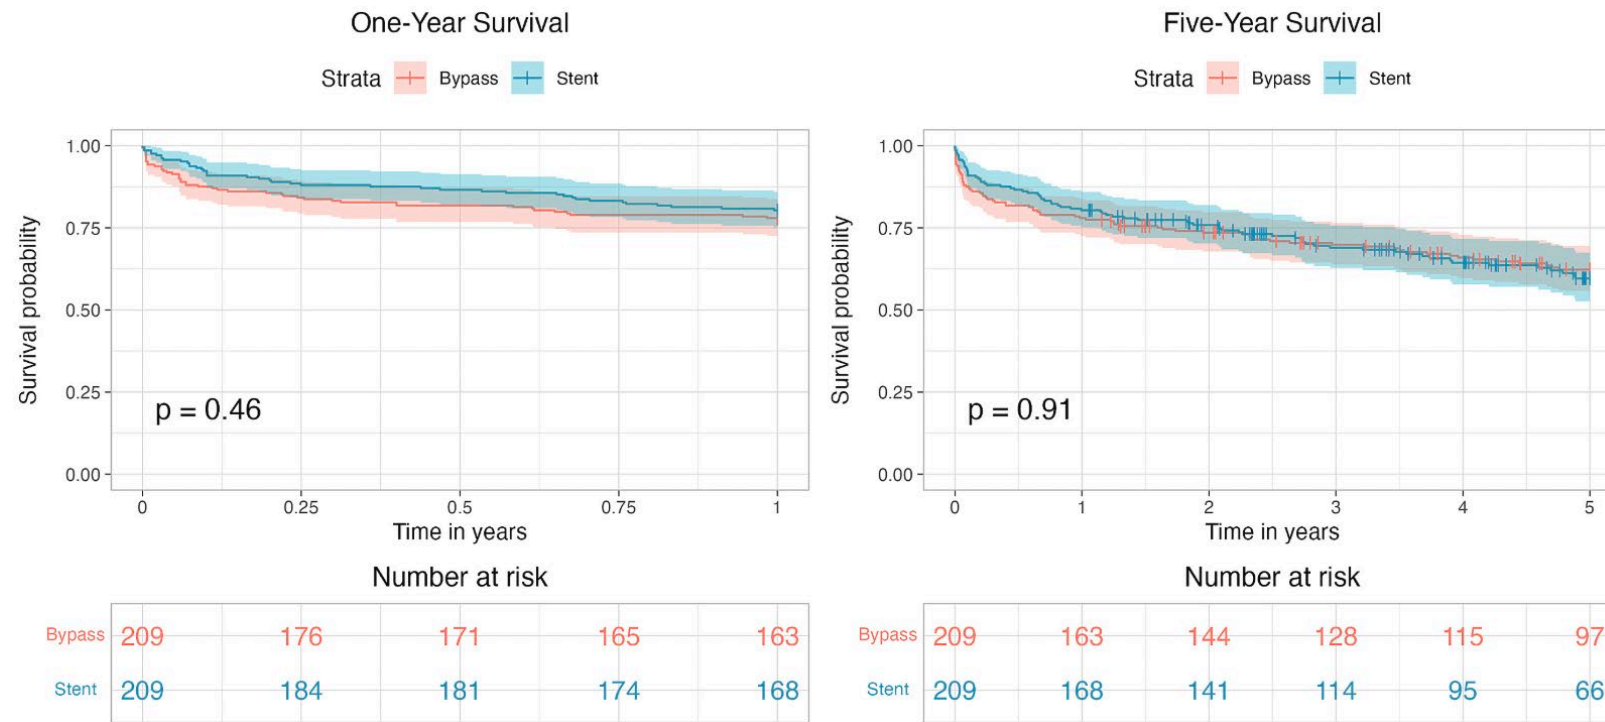

1. Relieving presenting symptoms

2. Preventing progression to acute mesenteric ischemia

3. Improving quality of life

**BEST TREATMENT  
OVERALL, NOT ONLY 30  
DAYS**

# 7. MORTALITY

- No differences in perioperative, one-year or five-year survival in propensity matched groups<sup>11</sup>.
- Findings further supported by five systematic reviews<sup>5-9</sup>.

# Goals of “BEST” Treatment

1. Relieving presenting symptoms

2. Preventing progression to acute mesenteric ischemia

3. Improving quality of life

**Quick fix may seem like the easy way out, a new pipe would actually solve the problem and be more durable longterm.**

# REBUTTAL

## OPEN SURGERY:

1. *Higher patency.*
2. *Higher freedom from symptom recurrence.*
3. *Fewer reinterventions.*
4. *Fewer anatomical constraints.*
5. *Lower risk of intraoperative embolization/dissection.*
6. *Equal perioperative mortality.*

# PERIOPERATIVE COMPLICATIONS & RECOVERY

- Limited data on cumulative complications/recovery, accounting for re-interventions.

Open revascularization cures the disease,  
endovascular treatment places it in remission

Dr. Michael Conte
